Cuando el Registro Hospitalario de Tumores del Instituto de Oncología "Dr. Heriberto Pieter" empezó sus labores de recolección de datos en 1998 e hicimos los primeros intentos de publicaciones estadísticas de cáncer en nuestra institución, nos dimos cuenta que tendríamos que enfrentar el grave problema de no disponer de datos referenciales propios, ni de otras instituciones y menos aún de lo que ocurría a nivel poblacional en el marco de la República Dominicana, lo que sabíamos iba a dificultar la validación y verificación de nuestros estudios. Nos erigimos como el primer granito de arena.

Hoy día, y luego de cinco años de labor ininterrumpida hemos aportado cuatro reportes anuales con datos estadísticos frescos y algunos estudios comparativos de los períodos anteriores, hemos publicado más de 10 reportes semestrales, respaldado más de 20 investigaciones del personal médico y colaborado con muchas iniciativas que se han transformado en aportes significativos al desarrollo de nuestra institución.

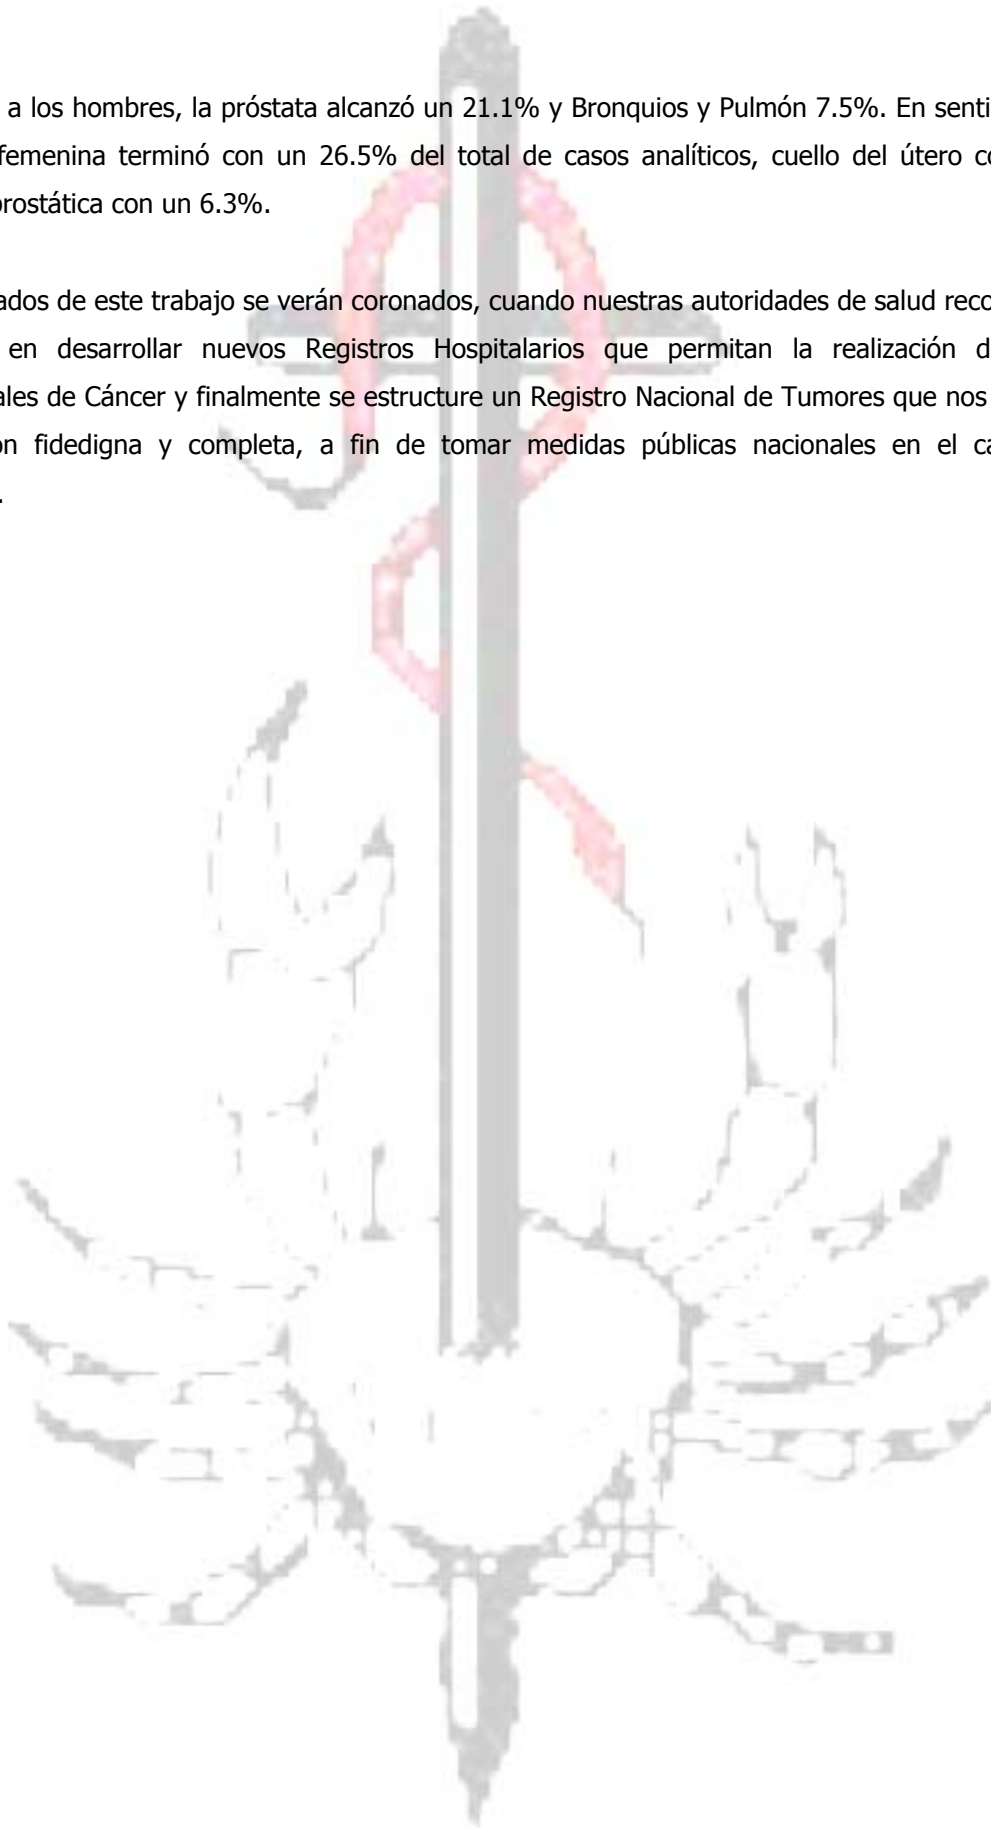

Celebramos nuestros cinco años de trabajo con la satisfacción de haber sido un poco más que una oficina de recolección y publicación de datos estadísticos, con la alegría de saber que nuestros esfuerzos por brindar informaciones y soluciones han sido bien acogidos y han ayudado al crecimiento de nuestro hospital y al mejoramiento del manejo de los pacientes.

Para esta ocasión, y como celebración de nuestro aniversario, hemos realizado un gran esfuerzo por recopilar y compilar **toda** la información obtenida en años anteriores y preparar nuestro **Primer reporte Comparativo**. Esto significa que ponemos a disposición del público y en un volumen único, todos nuestros informes anteriores además de los datos correspondientes al año 2001, lo que nos permitirá tener una visión clara de lo que ha sido el comportamiento del cáncer en nuestra institución para el período 1998 –2001.

Refiriéndonos al período de estudio más reciente que hemos completado (año 2001), los resultados arrojaron los siguientes datos: Se captó un total de 2,442 casos, de los cuales 2,104 (86.2%), fueron casos analíticos. Del total de casos analíticos, la mayoría resultó ser de sexo femenino, 70.2%. El grupo de edad más frecuente en hombres fue de 70-79 años, con un 24.1%, mientras que para las mujeres estuvo comprendido entre 40-49 años, con un 23.2%. Observamos que un 42.7% de las mujeres con cáncer para este año tiene menos de 50 años; mientras que sólo un 25.4% de los hombres estaba por debajo de esta edad. Un 45.4% de las mujeres pertenecía al grupo etáreo comprendido entre los 40 y los 59 años y un 47.4% de los hombres entre los 60 y los 79. Los principales sitios en mujeres fueron Mama con un 37.3% y Cuello del útero un 28.2%.

En cuanto a los hombres, la próstata alcanzó un 21.1% y Bronquios y Pulmón 7.5%. En sentido general, la Mama femenina terminó con un 26.5% del total de casos analíticos, cuello del útero con 19.8% y glándula prostática con un 6.3%.

Los resultados de este trabajo se verán coronados, cuando nuestras autoridades de salud reconozcan y se interesen en desarrollar nuevos Registros Hospitalarios que permitan la realización de Registros Poblacionales de Cáncer y finalmente se estructure un Registro Nacional de Tumores que nos ofrezca una información fidedigna y completa, a fin de tomar medidas públicas nacionales en el campo de la Oncología.

Después de más de seis años de continuo y esmerado trabajo, el Registro Hospitalario de Tumores del Instituto de Oncología "Dr. Heriberto Pieter" de la República Dominicana, publica el presente reporte con estadísticas que cubren la experiencia de esta institución hospitalaria durante los años de 1998 al 2001.

Son varias las razones que han hecho culminar el éxito y estabilidad del Registro. Entre ellas se hace necesario mencionar que bajo los auspicios de la Sociedad Contra el Cáncer de Noruega, la Unión Internacional Contra el Cáncer (UICC), el Colegio Americano de Cirujanos (ACoS) y el Instituto de Investigaciones de Cáncer "Maes-Heller" de Lima-Perú, se inició el proceso de entrenamiento del personal que desempeñaría sus labores en el actual registro de tumores.

Debemos agregar por su importancia, la labor de equipo que el registro ha desarrollado y el apoyo recibido por el mismo en la persona de la Dra. Catalina González Pons, Directora General del Instituto y la Sra. Rosa Emilia S. de Tavares, Presidenta de la Liga Dominicana Contra el Cáncer. También debemos resaltar la búsqueda y obtención del apoyo oficial del Ministerio de Salud Pública, que si bien no ha sido todo lo amplio que se necesita, al menos ha permitido iniciar y mantener las labores del registro.

El presente reporte ofrece un material de información al lector, bien sean estos médicos o líderes comunitarios, así como también un reto a las autoridades estatales, que se hacen conscientes de nuestra incapacidad para contar con tasas de incidencia y mortalidad fidedignas con las cuales hacer comparaciones y obtener reportes que consoliden el perfil epidemiológico de la República Dominicana, en especial la ciudad de Santo Domingo.

El presente informe confirma que el cáncer del cuello del útero es conjuntamente con el cáncer de la mama los de mayor frecuencia en el sexo femenino. Sin embargo, en el Instituto de Oncología "Dr. Heriberto Pieter" este último ha sobrepasado al cáncer del cuello del útero que ahora ocupa el segundo lugar. También notamos que el cáncer invasivo del cuello del útero no ha disminuido en nuestros enfermos. El plan de "tamizaje" que conjuntamente se ha venido desarrollando con el proyecto de "Detección y Prevención del Cáncer del Cuello Uterino" y que se limita a una región Sub-Urbana de la capital, auspiciado también por la UICC no podrá disminuir estos cánceres antes de algunos años.

El cáncer de la próstata es el más frecuente en los hombres, seguido por el cáncer del pulmón y en el tercer lugar el cáncer de la piel. También cabe destacar que el cáncer de la laringe y del pene alcanza un porcentaje elevado en el sexo masculino durante el mismo período.

Este reporte nos enseña entre otras variables importantes el número de casos vistos por sexo y grupo étnico, lugar de residencia al momento de diagnóstico, tipo de tratamiento inicial y estadiaje utilizando la aplicación de los manuales de la AJCC, 5ta edición, (TNM), y el Sumario General de SEER.

Este primer informe consolida aún más la necesidad de desarrollar Registros Hospitalarios de Tumores en todas las instituciones que tratan pacientes con cáncer, para crear la infraestructura de trabajo que nos lleve al futuro del Registro Poblacional. Este Registro necesitará utilizar datos fiables del censo de la población dominicana.

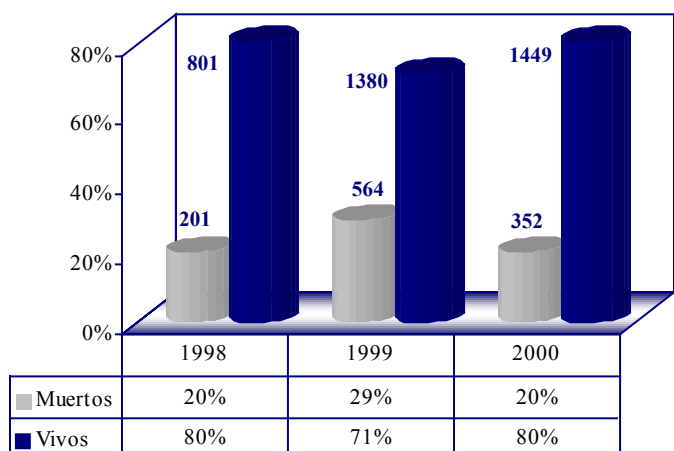

Esperemos que la comunidad dominicana, así como el Ministerio de Salud Pública den la debida atención a este reporte. Merece la pena dedicar un tiempo ahora al análisis del mismo, para desarrollar más complejas soluciones para la lucha contra el cáncer.
